

**Household Observation for Pandemic Preparedness
and Endemic Respiratory Viruses Study**

Acronym: HOPPER study

**Participant Information Sheet -
Children 5-10 years old**

**Hi, I'm Dr HOPPER.
You've been asked to
take part in a study.
I'm here to tell you all about it!**

What's the study about?

- There are tiny germs called viruses that can spread from person to person. They can give people coughs, colds, or make it harder to breathe.
- Some children and adults only feel a little bit poorly, but others can feel much more unwell and may need to go to hospital.
- We want to learn more about why people's bodies react in different ways to these viruses. This will help doctors and nurses take better care of people and keep everyone as healthy as possible.

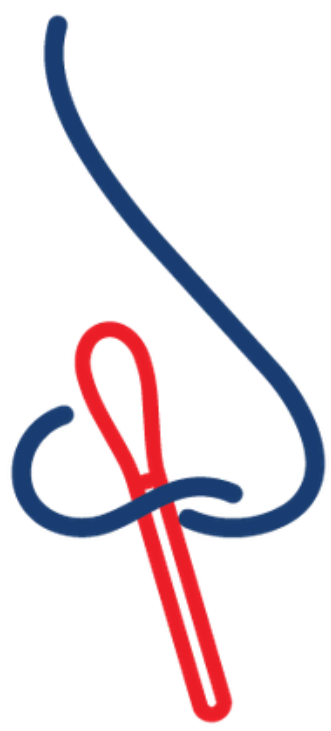

And why is it important?

- We want to learn more about these viruses and how they affect people's bodies.
- If we understand how the body fights these viruses, scientists can help doctors and nurses find better ways to help people get better and stay healthy.

The grown-up who looks after you will tell us a bit about you and how you are feeling. They will also help us collect some small samples from you. These might be:

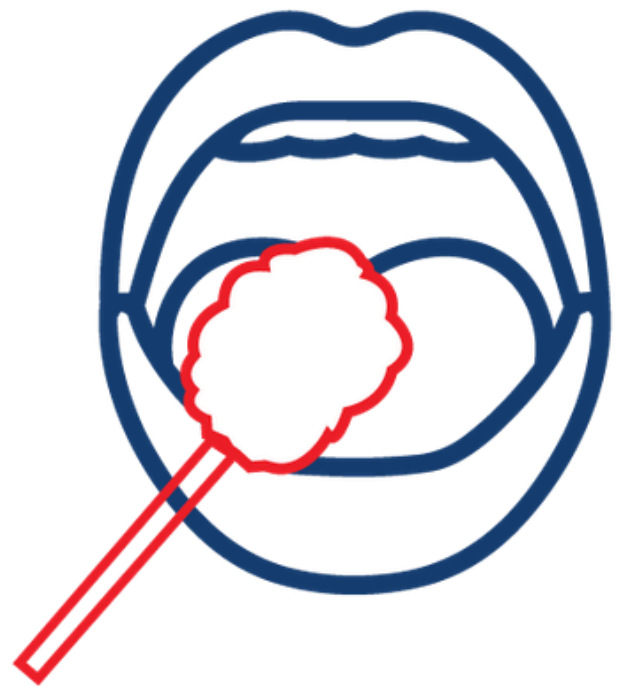

SWAB OF YOUR NOSE

They will help you to gently put the swab into each nostril, one at a time. Do not push it in but slowly twist it inside your nose.

SWAB OF YOUR HAND

They will ask you to open your hand with your palm facing up. Then, they will help you gently rub the bud all over your palm, the lines on your hand, and between your fingers.

ORAL FLUID

They will help you to gently brush your gums with a sponge. Try not to touch your teeth or tongue and count to 30 while doing this.

NOSE FLUID

They will help you to gently put the entire paper strip into one nostril, then the other. They will softly press it on the outside of your nose and count to 30 while doing this.

LATERAL FLOW DEVICE

This device helps to find out what virus causes the infections you have. It is done the same way as a nose swab.

Your help is important!

By taking these samples, you're helping us learn about
germs and helping make things better for everyone.
That's something to feel proud of!

Got a question?

**Just ask the grown-up who looks after you.
If they also don't know,
ask them to ask the HOPPER study team**

And that's it!
